Outlines

- Summary
- IBA Setup & techniques
- IBA applications: case studies
- Perspectives

Summary

- Ion beam analysis laboratory based on Pelletron accelerator
- Installation in 1999 within an IAEA TC project
- Performing PIXE, PIGE, RBS/EBS, ERD techniques
- Applications in archeology, environment, pharmaceuticals and materials science
- Large number of samples: coins, soil, sediments, pharmaceutical drugs, aerosol filters and *ceramics*
- Development and upgrading of experimental setup for a better performance and wider applications

Experimental setup & Analytical Techniques

- ✓ 5SDH pelletron tandem accelerator of 1.7 MV from NEC
- ✓ Gupix software package & SIMNRA, **MPAWIN**, **DppMCA**

❖ Alphasources
ion source

❖ Protons
beam:
0.3-3.4 MeV
1-200 nA

❖ Alpha-

ION BEAM ANALYSIS TECHNIQUES IBA

TECHNIQUE	ACRONYM	PARTICLE/RADIATION MEASURED
Particle-Induced X-ray Emission	PIXE	Characteristic x-rays
Rutherford Back-scattering Spectrometry	RBS	Elastically scattered ions in backward angles
Elastic Recoil Detection Analysis	ERDA	Recoiled target nuclei
Nuclear Reaction Analysis	NRA	Prompt product particles or gamma-rays (PIGE)

Often two or more of these techniques are carried out simultaneously in order to obtain complementary information

CONVENTIONAL EXPERIMENTAL SETUP :

Preamplifier + Amplifier + Current Integrator

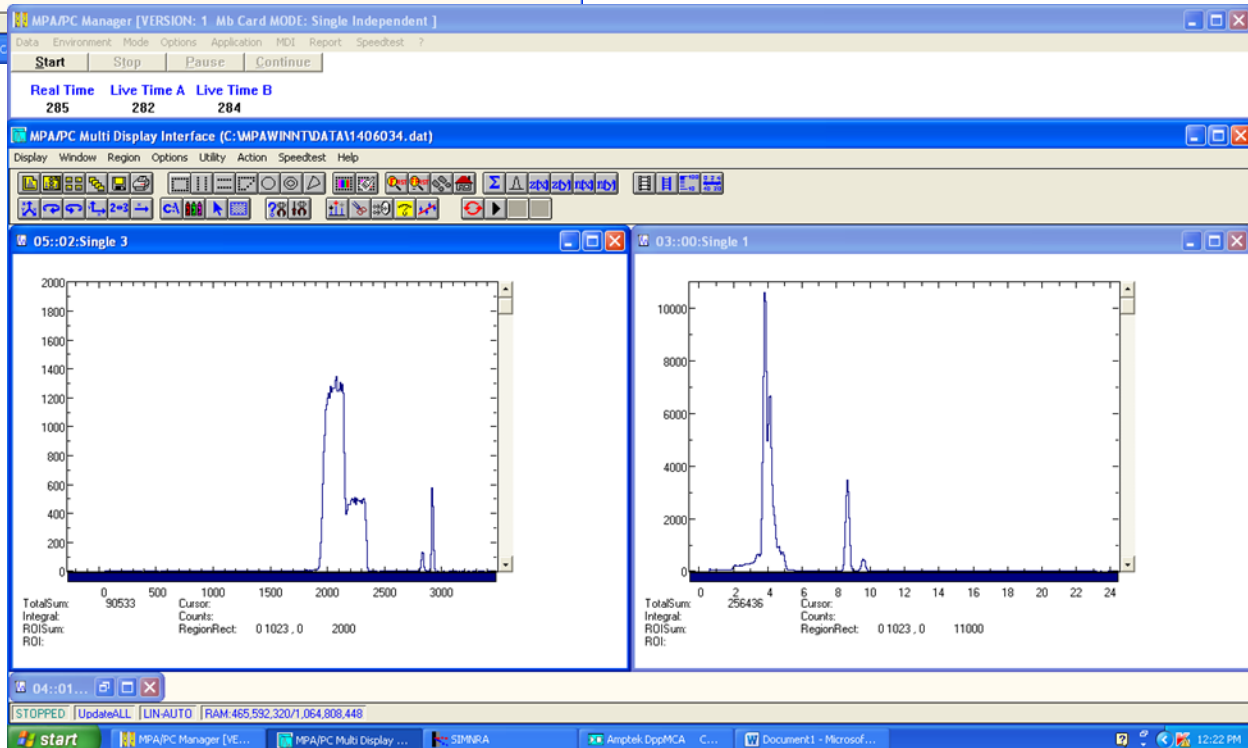

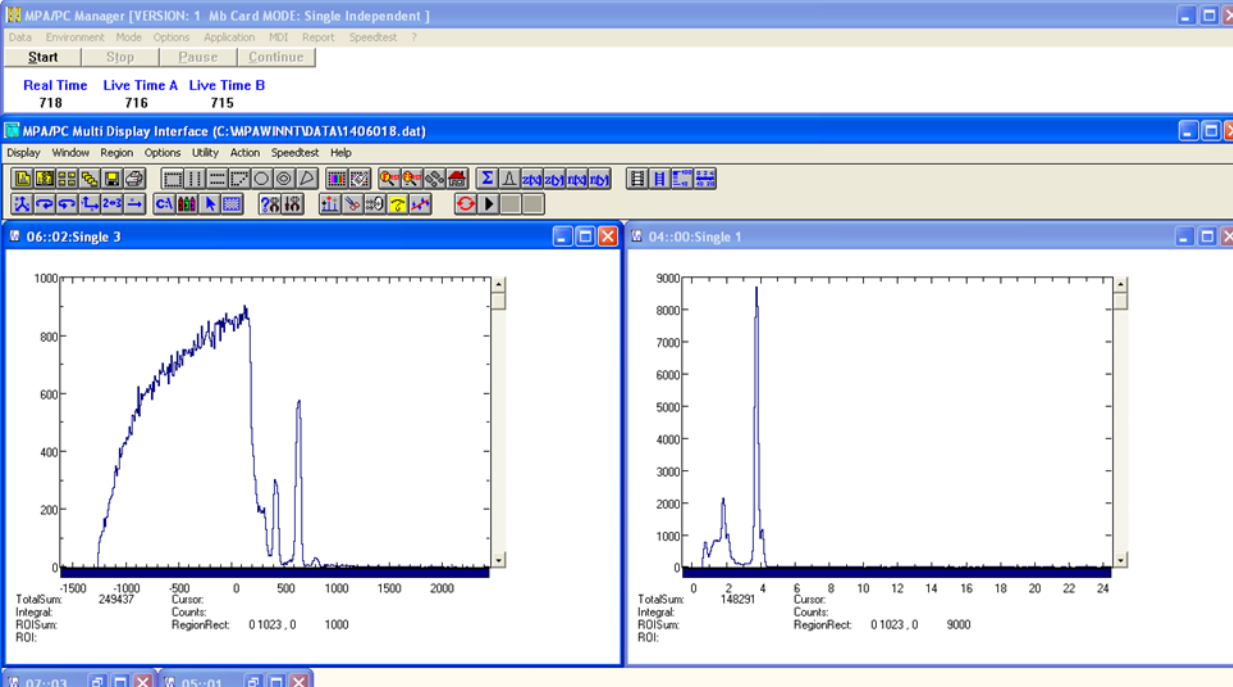

MPAWIN

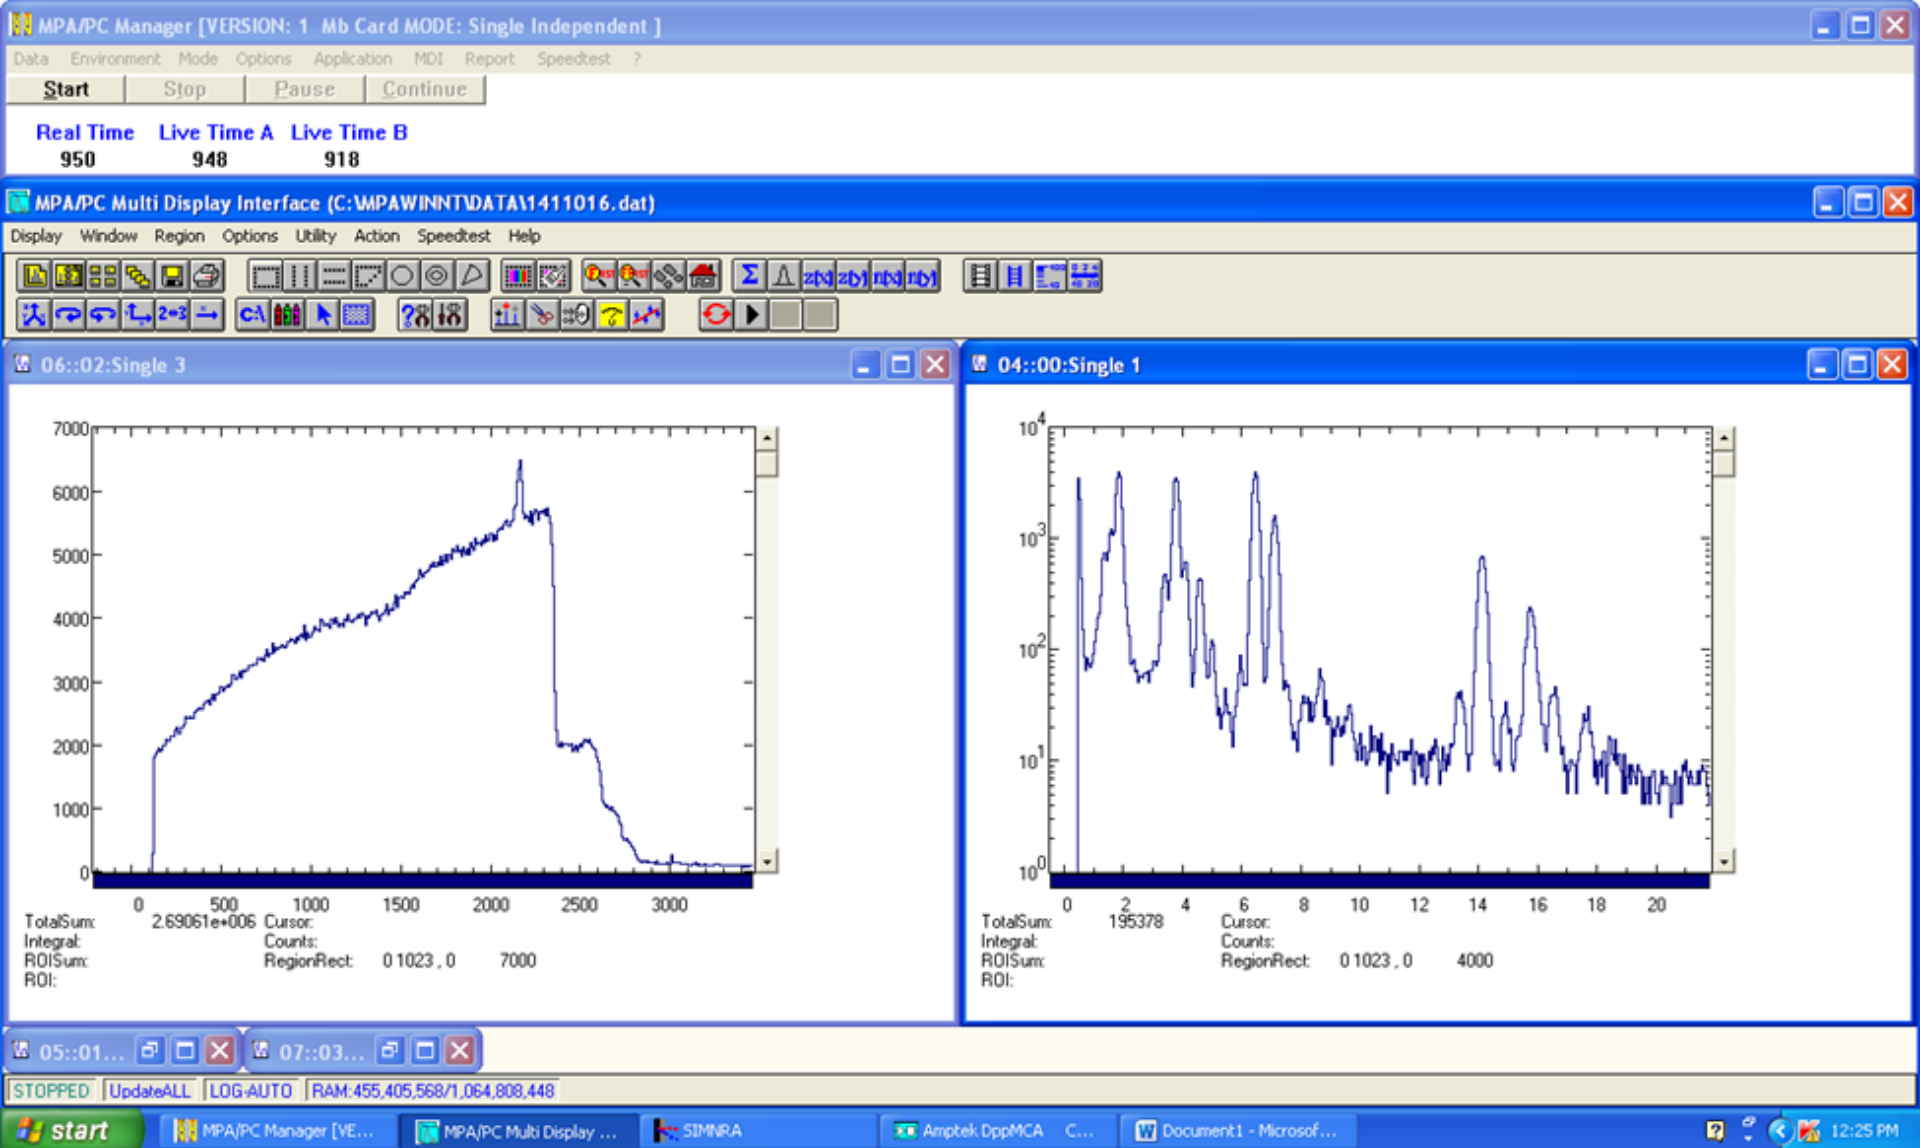

MCA and ADCs (up to 8) and Counter
Camera

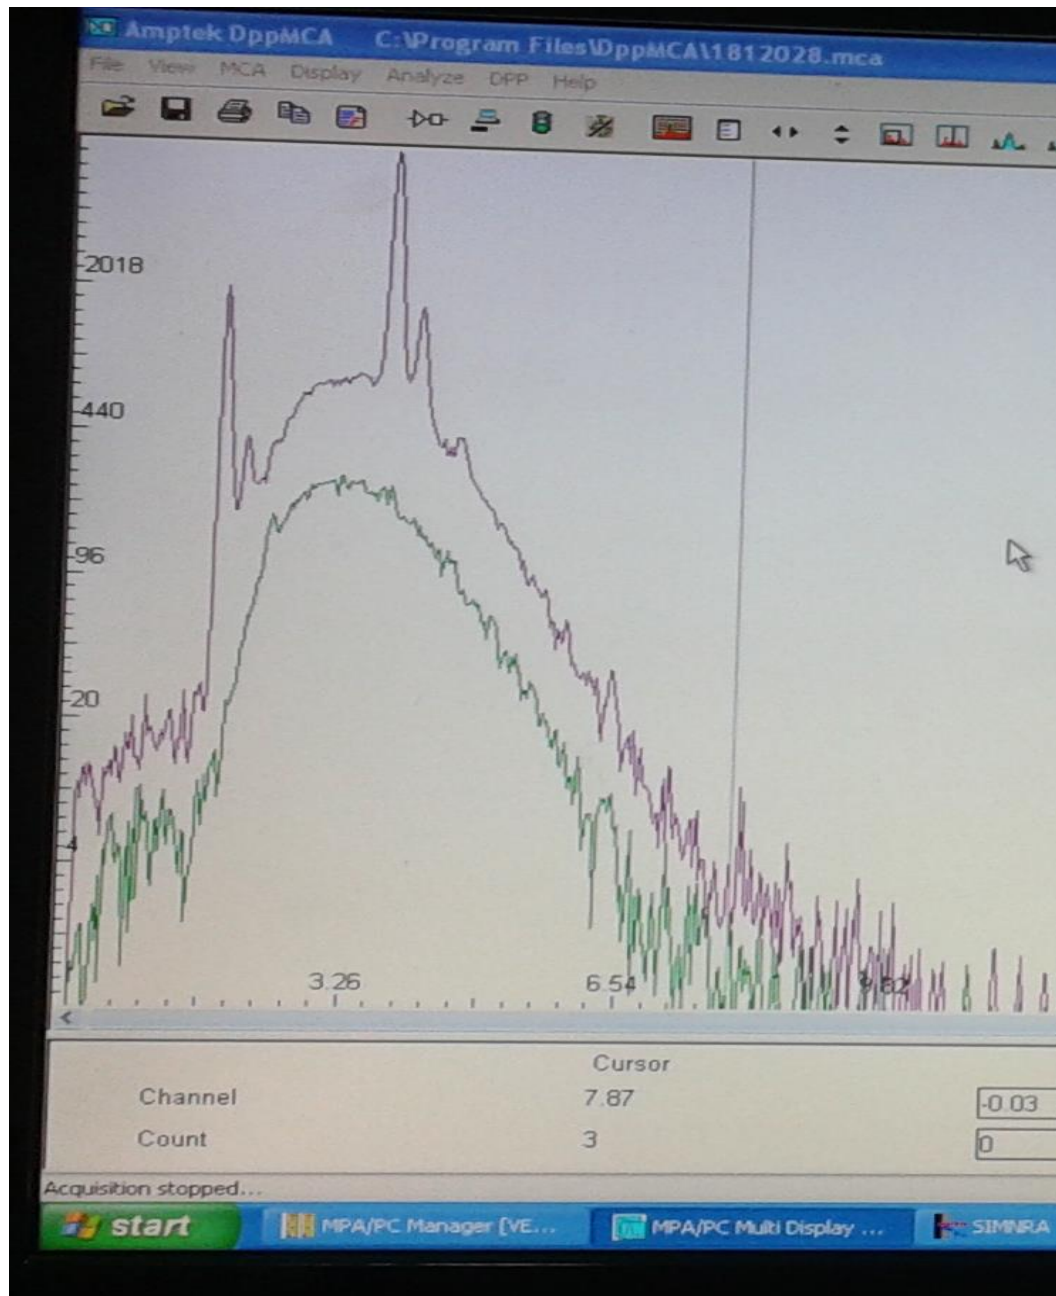

Micromatter Standards

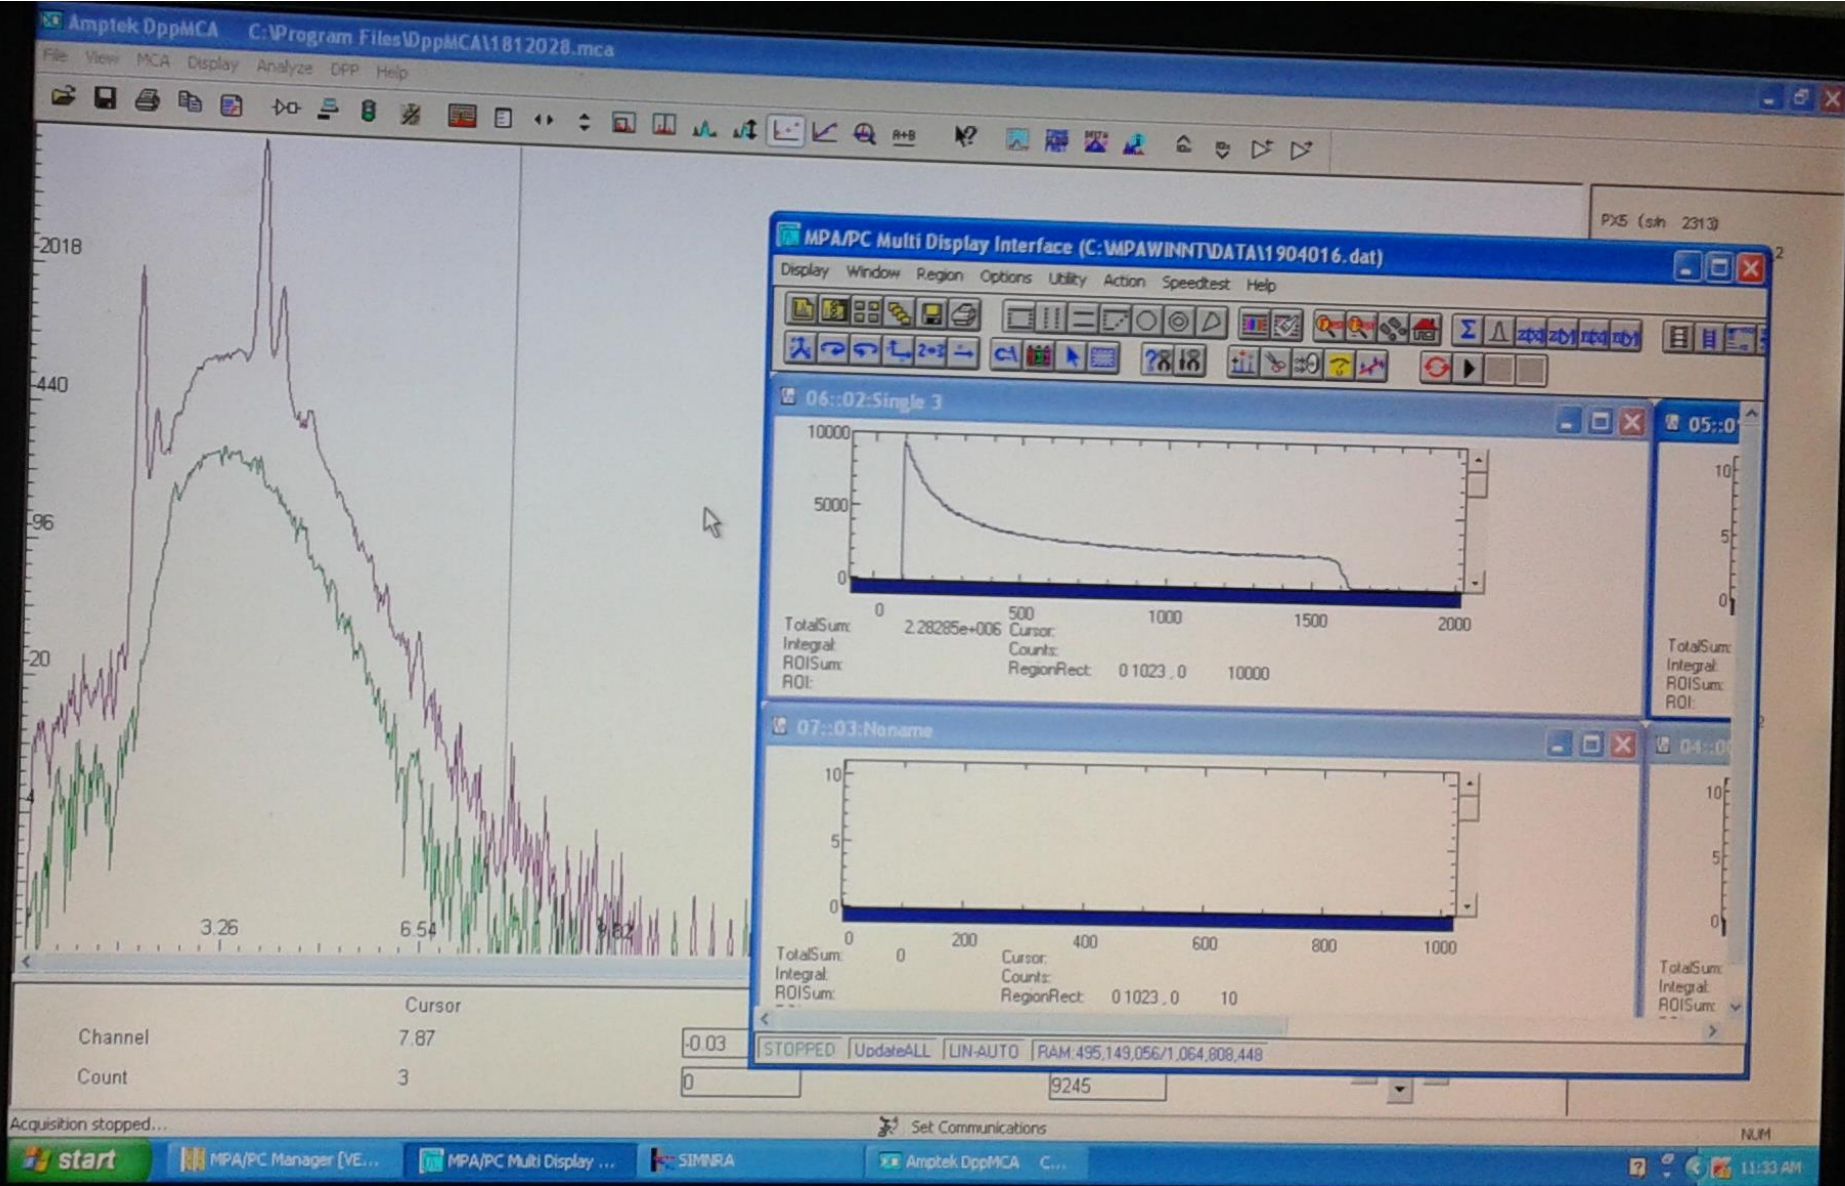

Geostandards

DppMCA

Silicon Drift Detector (130 eV)

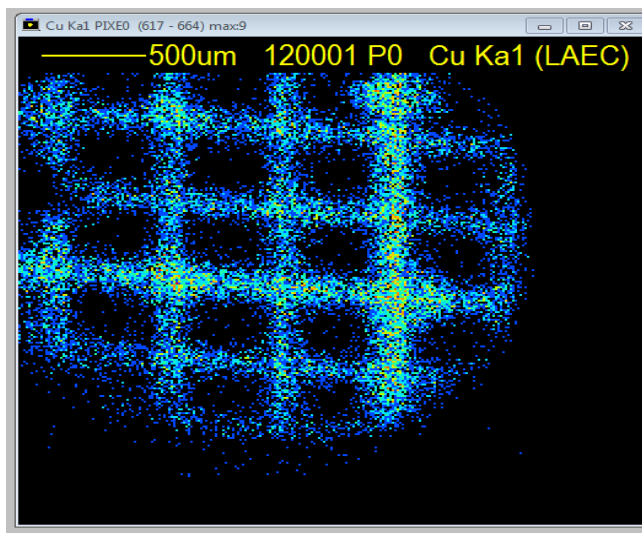

MPAWIN and DppMCA

Technical upgrading of experimental setup

1- IAEA TC project LEB/0/006: "Improving Analytical Capabilities and Technical Performance of the Pelletron Accelerator" (2014-2017)

2- IAEA TC project concept LEB/0/008: "Enhancing the Performance and Capacity of the New External Microbeam for the Analysis of Biomedical and Atmospheric Aerosol Samples" (2016-2019)

External Micro-Beam

Dual Ion Source

Duoplasmatron
protons ($20\ \mu\text{A}$)

Alphatross RF
alpha ($2.4\ \mu\text{A}$)
protons ($4.2\ \mu\text{A}$)

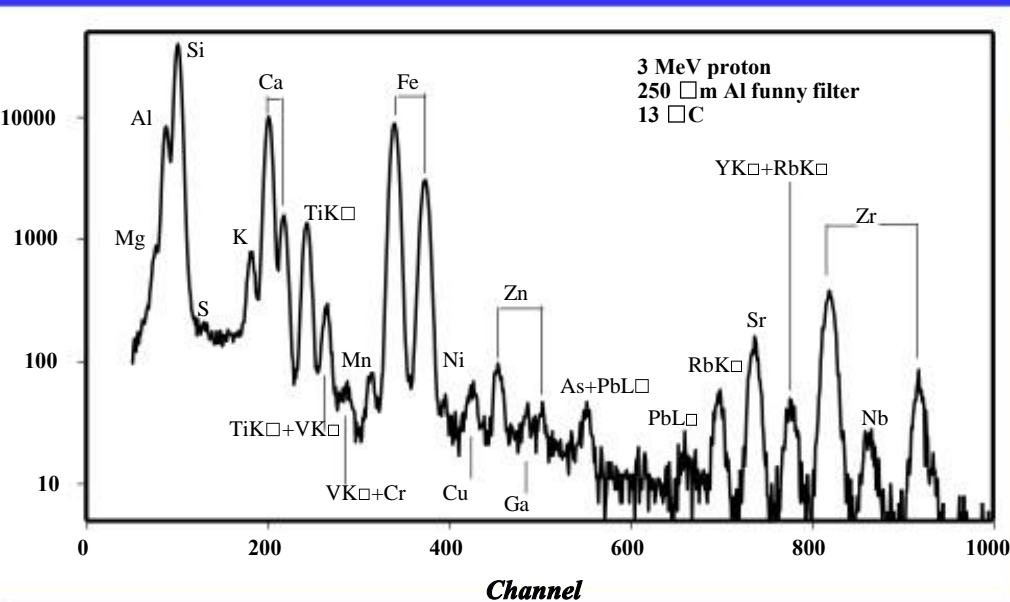

IBA Applications: Cultural Heritage

- PIXE is applied to analyze objects relevant to Art and Archeology: pottery, glass, coins, paintings, statues, manuscripts,...
- Answer questions of **provenance and authenticity**
- Ceramics are most abundant and most studied archeological findings
- PIXE and cluster analysis of excavated potsherds:
 - characterize workshop production
 - attribution and provenance
 - valuable insight into ancient trade connections
- Establish a database of ceramic elemental composition: more than 600 objects

Provenance study of excavated pottery from Beirut using PIXE cluster analysis

ABSTRACT

We applied the proton-induced X-ray emission (PIXE) analytical technique to twenty-eight medieval silver coins, selected from the Tunisian treasury. The purpose is to study the fineness evolution from the beginning of the 7th to the 15th centuries AD. Each silver coin was cleaned with a diluted acid solution and then exposed to a 3 MeV proton beam from a .7 MV tandem accelerator. To allow the simultaneous detection of light and heavy elements, a funny aluminum filter was positioned in front of the Si(Li) detector entrance which is placed at 135° to the beam direction. The elements Cu, Pb, and Au were observed in the studied coins along with the major component silver. The concentration of Ag, presumably the main constituent of the coins, varies from 55% to 99%. This significant variation in the concentration of the major constituent reveals the economical difficulties encountered by each dynasty. It could be also attributed to differences in the composition of the silver mines used to strike the coins in different locations. That fineness evolution also reflects the poor quality of the control practices during this medieval period. In order to verify the ability of PIXE analytical method to distinguish between apparently similar coins, we applied hierarchical cluster analysis to our results to classify them into different subgroups of similar elemental composition.

Quality control

ABSTRACT

PIXE and RBS analysis is used to investigate the elemental content of modern Lebanese coins, in order to control their minting quality. The coins of interest were 100, 250 and 500 Lebanese Lira (LL), which are mainly bulky metals with or without coated layer. Using 3 MeV protons, proton induced X-ray emission PIXE identified and quantified elements while Rutherford backscattering spectrometry RBS checked the

powerful tool to investigate the experimental protocol.
