# **Ocean Dynamics**

- The ocean is a thin fluid envelope spread on a rapidly rotating Earth. Dynamics are largely two-dimensional with weak vertical variation.
- Behavior is governed by the dimensionless Rossby number Ro = U/Lf, ratio of local vorticity to planetary vorticity.
- Goal: understand effect of weak 3D variation using dynamically consistent models

Motivation	Tools and Equations	Model Derivation		Conclusions	References
0000

# Stirring/Mixing (Welander, 1955)

Cecily Keppel, UCSD

Motivation	Tools and Equations	Model Derivation	Vortex 00000000	Tracer 0000000	Conclusions	References

# Background

- In oceanography and fluid mechanics, people have developed tools to understand mixing based on Hamiltonian 2D dynamics (Samelson & Wiggins 2006, Mezic *et al* 2010)
- How are these tools relevant to properties of 3D flow? (Theme of MURI)
- The simplest possible 3D flow will be nearly 2D with weak variation in the third direction, consider ocean context.

Motivation 00●0	Tools and Equations	Model Derivation	Vortex 00000000	Tracer 0000000	Conclusions	References

Motivation	Tools and Equations	Model Derivation		Conclusions	References
	0000				

# Stirring vs. Mixing

- Previous tools are indicators of stirring
- Shear has a strong effect on mixing (e.g. Taylor dispersion)
- What is the effect of vertical shear on these systems?
- What tools take this ( $P \acute{e} = UL/D$ ) into account?

Motivation	Tools and Equations	Model Derivation		Conclusions	References
	0000				

# The SQG Model

- QG and SQG are valid for Ro << 1</p>
- They conserve potential vorticity
- SQG has 0 potential vorticity in the interior and some  $\theta$  on the boundary (Held *et al* 1995)
- SQG is nice because the dynamics are 2D while the interior fluid motion is 3D!

3-Vort	ex Problem					

We want the simplest possible dynamically consistent flow field:

Three classical point vortices (which have regular motion) induce chaotic motion in passive scalars. We wish to understand the transport properties of SQG point vortices in the fluid interior and boundary.

Cecily Keppel, UCSD SQG Vortices

Motivation	Tools and Equations	Model Derivation	Vortex	Conclusions	References
			0000000		

#### Equations of Motion on the Surface

$$\theta_0 = \sum_n \kappa_n \delta(x - x_n) \delta(y - y_n)$$
$$(\dot{x}_n, \dot{y}_n) = \sum_{m \neq n} \frac{\kappa_m}{2\pi} \frac{1}{|\vec{x}_n - \vec{x}_m|^3} (-y_n + y_m, x_n - x_m)$$

Hamiltonian system:

$$\psi_0 = \frac{1}{2\pi |\vec{x} - \vec{x}_n|}$$
$$\vec{u}_0 = \sum_n \frac{\kappa_n}{2\pi |\vec{x} - \vec{x}_n|^3} (-y + y_n, x - x_n, 0)$$

→ E → < E →</p>

Dynamically (asymptotically) consistent

# Change of Variables

We follow the analysis for classical point vortices, all of unit strength, by Aref & Pomphrey (1982) and Kuznetsov & Zaslavsky (1998):

~

$$z_{j} = \frac{1}{\sqrt{3}} \sum_{n=1}^{2} \sqrt{2J_{n}} e^{i\theta_{n}} e^{-2i\pi n(j-1)/3}$$
$$l_{1} = \frac{J_{2} - J_{1}}{2} = A_{123}/\sqrt{3} \qquad l_{2} = \frac{J_{2} + J_{1}}{2} = L^{2}/4$$

 $A_{123}$  is the signed area of the vortex triangle,  $L^2 = \sum |z_j|^2$ 

$$\phi_1 = \theta_2 - \theta_1 \qquad \qquad \phi_2 = \theta_2 + \theta_1$$

- \* ロ > \* @ > \* 注 > \* 注 > … 注 … のへで

Cecily Keppel, UCSD

Motivation	Tools and Equations	Model Derivation	Vortex	Conclusions	References
			00000000		

#### Change of Variables

Finally let 
$$I = \left(\frac{l_1}{l_2}\right)^2 = \frac{16}{3}A^2/L^4$$
.  
SQG:  
 $H = \frac{1}{2\pi}\sum_{i < j}\frac{1}{|z_j - z_i|}$   
Now  $H = f(I, \cos(3\phi_1))$ 

Also 
$$\dot{I} = \frac{2I}{(I_2)^2} \frac{\partial H}{\partial \phi_1} = g(I, \sin(3\phi_1))$$

Using the system of equations, we numerically determine I(I) and consider the potential function  $-I^2$ .

# Calculating Period

 $T = 2 \int_{l_{\min}}^{l_{\max}} \frac{dl}{|\dot{l}|}$ 

Recall that  $I \propto A$ , so this period reflects a return to the initial area, but with vortices permuted.

In order to return to the initial state, we will need to multiply by either 2 or 3 depending on the regime of motion, yielding  $T_{rel}$ .

			0000000		

# **Calculating Shift**

Here's where  $\phi_2$  matters...

Given  $\dot{\phi}_2 = -\frac{\partial H}{\partial I_2}$ 

Then  $\phi_2 = \int^{l(t)} \frac{\dot{\phi_2}}{|\dot{l}|} dl$ 

2

And the shift in angle is simply  $\phi_2(T_{rel}) - \phi_2(0)$ , found numerically from the above integral.

Cecily Keppel, UCSD SQG Vortices

### Interior Flow Field

We wish to determine the vertical velocity. In the asymptotic procedure to obtain QG equations, we begin by expanding the streamfunction and vorticity potentials  $\psi$ , *F*, *G*.

 $\epsilon = \textit{Ro}$ 

$$\psi \sim \psi_0 + \epsilon \psi_1 + \epsilon^2 \psi_2 + \cdots$$
  

$$F \sim \epsilon F_1 + \epsilon^2 F_2 + \cdots$$
  

$$G \sim \epsilon G_1 + \epsilon^2 G_2 + \cdots$$

Motivation	Tools and Equations	Model Derivation	Vortex 00000000	Tracer o●ooooo	Conclusions	References

#### Interior Flow Field

Our system is governed by

$$\nabla^{2}\psi_{0} = 0 \qquad \qquad \frac{\partial\psi_{0}^{s}}{\partial z} = \theta_{0}$$

$$\nabla^{2}F_{1} = 2J\left(\frac{\partial\psi_{0}}{\partial z}, v_{0}\right) \qquad \nabla^{2}G_{1} = 2J\left(\frac{\partial\psi_{0}}{\partial z}, -u_{0}\right)$$

$$\left(\frac{\partial F_{1}}{\partial x} + \frac{\partial G_{1}}{\partial y}\right)^{s} = 0$$

$$\nabla^{2}\psi_{1} = \left|\nabla\frac{\partial\psi_{0}}{\partial z}\right|^{2} \qquad \left(\frac{\partial\psi_{1}}{\partial z} + \frac{\partial G_{1}}{\partial x} - \frac{\partial F_{1}}{\partial y}\right)^{s} = \theta_{1}^{s} = 0$$

where *s* indicates at the surface, z = 0.

# **3D Transport**

For vortices we first take  $w_1$  but not  $u_1$ ,  $v_1$  (yet unknown):

$$w_1 = 3z \sum_n \frac{\kappa_n}{2\pi} \frac{\left(\vec{u}_0 - \dot{\vec{x}}_n\right) \cdot \left(\vec{x} - \vec{x}_n\right)}{|\vec{x} - \vec{x}_n|^5}$$

- We then compute Poincaré maps for particles advected by the flow, and project the maps to the x-y plane.
- By comparing the plots created by particles at different heights, we observe the effect of 3D motion on the paths.

# Conclusions

 SQG vortices constitute an interesting model system: 2D dynamics and 3D transport.

- Vortex motion can be described using geometric variables to numerically determine period and shift.
- Vortex motion is regular but transport can be chaotic.
- Particle's initial height has clear effect on transport.
- This system comes from "perturbing" Hamiltonian equations. Is there a connection to KAM which perturbs the Hamiltonian? Are there theorems that apply?

Motivation	Tools and Equations	Model Derivation	Vortex 00000000	Tracer 0000000	Conclusions ●○	References
